

# Langkah-Langkah Instalasi CMS Wordpress di Domain Sendiri

(Juli 2008)

Dokumen Ini adalah Bebas, bebas di distribusikan dengan bebagai media yang ada. Bisa ditulis ulang dengan tetap mencantumkan sumber yang ada. Jika pada dokumen ini mungkin terdapat kesalahan silahkan email ke [imam\\_te@yahoo.com](mailto:imam_te@yahoo.com) untuk penjelasan dan perubahan. Terima kasih

Langkah berikut dilakukan dengan asumsi anda sudah punya domain sendiri dan setting hosting (NS dan Domain) sudah berhasil. Jika Belum anda perlu membaca Tutorial “Membuat Domain baru dan Hosting Gratis”

1. Jika anda perlu domain baru DOT ID anda bias masuk kesini : register.net.id  
<https://register.net.id/>
2. Jika perlu Free Hosting (Gratis) bisa menggunakan 000Webhost di  
<http://www.000webhost.com/?id=31024>

## A. Mendapatkan file CMS Wordpress :

1. Download file CMS terbaru di : <http://wordpress.org/latest.zip>

[Download WordPress 2.5](#)  
.zip – 1.2 MB

2. Perhatian, link diatas mungkin berbeda Silahkan Cek Wordpress terbaru
3. Simpan Files
4. Ekstrak file “latest.zip”

## B. Mengupload CMS Wordpress ke Server

1. Siapkan Program FTP Client, misalnya : <http://filezilla-project.org>
2. Login ke FTP server web anda dengan user dan password yang benar
3. Letakan Files di Direktori /public\_html

## C. Persiapan Seting awal :

1. Masuk ke Control Panel Web Anda, misal untuk Hosting di 000webhost.com cpanel ada di [www.domain\\_anda/cpanel](http://www.domain_anda/cpanel) atau <http://64.191.112.53:2082>
2. Buat Database MySQL, misal dengan nama Wordpress
3. Buat user dan password untuk mengakses database
4. Perhatian : (catat Database, User, dan password)

## D. Mulai Instalasi CMS Wordpress :

1. Buka Website anda missal [www.imm.web.id](http://www.imm.web.id)
2. Create a Configuration File

3. Jika ada tampil “ Sory, I can’t write ..... Wp-config.php...”
4. Silahkan masuk menggunakan **FTP / File Manager di Control Panel Web**
5. Ubah Atribut folder public\_html ke mode 777 (Klik kanan Folder → Set 777)
6. Kembali ke Buka website Anda “Create a Configuration File “
7. Let’s Go
8. Isikan : Nama database, User, Password, Host (biasanya localhost), Table Prefix
9. Submit
10. Run Install
11. Isi Blog Title dan Email : “Install wordpress”
12. Anda mendapatkan user dan password sementara : Log In
13. Anda masuk ke Dashboard, jangan lupa segera ganti Password anda!
14. Anda bias segera mengisi Blog anda yang baru, untuk modifikasi Blog anda bisa membaca Tutorial “Langkah Modifikasi CMS Wordpress”

## E. Screenshots Instalasi CMS Wordpress

There doesn't seem to be a `wp-config.php` file. I need this before we can get started. Need more [We got it](#). You can create a `wp-config.php` file through a web interface, but this doesn't work for server setups. The safest way is to manually create the file.

### Create a Configuration File

1. Buka Website anda missal [www.imm.web.id](http://www.imm.web.id)

Sorry, I can't write to the directory. You'll have to either change the permissions on your WordPress directory or create your `wp-config.php` manually.

2. Create a Configuration File
3. Jika ada tampil “ Sory, I can’t write ..... Wp-config.php...”

4. Silahkan masuk menggunakan FTP
5. Ubah Atribut folder public\_html ke mode 777 (Klik kanan Folder → Set 777)

Welcome to WordPress. Before getting started, we need some information on the database. You will need to know the following items before proceeding.

1. Database name
2. Database username
3. Database password
4. Database host
5. Table prefix (if you want to run more than one WordPress in a single database)

If for any reason this automatic file creation doesn't work, don't worry. All this does is fill in the database information to a configuration file. You may also simply open `wp-config-sample.php` in a text editor, fill in your information, and save it as `wp-config.php`.

In all likelihood, these items were supplied to you by your ISP. If you do not have this information, then you will need to contact them before you can continue. If you're all ready...

[Let's go!](#)

6. Kembali ke Buka website Anda “Create a Configuration File “
7. Let's Go

Below you should enter your database connection details. If you're not sure about these, contact your host.

<b>Database Name</b>	<input type="text" value="redacted"/>	The name of the database you want to run WP in.
<b>User Name</b>	<input type="text" value="redacted"/>	Your MySQL username
<b>Password</b>	<input type="text" value="redacted"/>	...and MySQL password.
<b>Database Host</b>	<input type="text" value="localhost"/>	99% chance you won't need to change this value.
<b>Table Prefix</b>	<input type="text" value="wp_"/>	If you want to run multiple WordPress installations in a single database, change this.

**Submit**

8. Isikan : Nama database, User, Password, Host (biasanya localhost), Table Prefix
9. Submit

All right sparky! You've made it through this part of the installation. WordPress can now communicate with your database. If you are ready, time now to...

**Run the install**

## 10. Run Install

### Information needed

Please provide the following information. Don't worry, you can always change these settings later.

<b>Blog Title</b>	<input type="text" value="Be + Thinking"/>
<b>Your E-mail</b>	<input type="text" value="irmam_te@yahoo.com"/> Double-check your email address before continuing.
<input checked="" type="checkbox"/> Allow my blog to appear in search engines like Google and Technorati.	
<b>Install WordPress</b>	

11. Isi Blog Title dan Email : "Install wordpress"

WordPress has been installed. Were you ex
